

Smartphones have now become an essential companion in people's daily lives. But when the battery wears out quickly, using the phone becomes troublesome.

Experts say that by changing a few habits, it is possible to keep a mobile phone's battery lasting longer.

Charging habits

Many people either charge the battery only after it's completely drained or always keep it at 100%. Both habits are harmful. It's best to keep the battery level between 20% and 80%. This helps the battery last longer.

Avoid overcharging

Leaving the phone plugged in overnight is a common habit. This puts pressure on the battery and causes long-term damage. It's better to unplug the charger once the battery is full.

Maintain proper temperature

Batteries get most damaged by excessive heat. Leaving the phone under direct sunlight, playing games for a long time, or using heavy apps can cause it to heat up quickly. Such situations should be avoided.

Use original chargers

Using non-original chargers or data cables can damage the battery faster. Therefore, it's safest to always use the charger approved by the phone's manufacturer.

Avoid using the phone while charging

Watching videos or playing games while the phone is charging causes the battery to heat up excessively, reducing its lifespan. So, it's best to avoid using the phone during charging.

Software updates

Regularly updating the operating system and apps helps maintain the phone's performance. It also makes battery usage more efficient.

Use power saver mode

Turning off location, Bluetooth, and Wi-Fi when not needed, and keeping the power saver mode on, can reduce battery consumption.
